heat-stable antigen M1/69-J1ld precursor - mouse
N.Alternate names: CD24 protein; nectadrin
C;Species: Mus musculus (house mouse)
C;Date: 06-Nov-1992 #sequence revision 06-Nov-1992 #text change 31-Jan-2000
C;Accession: A43537; I48287; S15784; S15783; S43709; S32240; S33129
R;Kay, R.; Takel, F.; Humphries, R.K.
J. Immunol. 145, 1952-1959, 1990
A;Title: Expression cloning of a cDNA encoding M1/69-J1ld heat-stable antigens.
A;Reference number: A43537; MUID:90361906; PMID:2118158

CATALYTIC ACTIVITY: S-adenosyl-L-methionine + putrescine = S-adenosyl-L-homocysteine + N-methylputrescine.

PATHWAY: Nicotine biosynthesis.

TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN ROOTS.

SIMILARITY: BELONGS TO THE SPERMIDINE/SPERMINE SYNTHASES FAMILY.

DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin
heparan sulfate. Binds collagens type I and type II through
leucine-rich repeat domain (By similarity).

SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN
(SLRP) FAMILY. CLASS II SUBFAMILY.

SIMILARITY: Contains 12 leucine-rich (LRR) repeats.

                                                                                                                                                                                                                                                                  SUBCELULAR LOCATION: Secreted; extracellular matrix.

SUBCELULAR LOCATION: Secreted; extracellular matrix.

TISSUE SPECIFICITY: Expressed in cartilage throughout both fetal development and post-natal life. It is also expressed in the developing embryo prior to skeletogenesis. In adult, highest expression in lung, lower levels in cardiac and skeletal muscle. DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin and heparan sulfate. Binds collagens type I and type II through its heparan sulfate. Binds collagens type I and type II through its leucine-rich repeat domain (By similarity).

SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN (SLRP) FAMILY. CLASS II SUBFAMILY.
                                                                                                                                                                                                                                                (SLRP) FAMILY. CLASS II SUBFAMILY. SIMILARITY: Contains 12 leucine-rich (LRR) repeats.

                                                                                                                                        -!- SUBUNIT: Binds the basement membrane heparan sulfate proteoglycan perlecan and triple helical collagens type I and type II.
-!- SUBCELLULAR LOCATION: Secreted; extracellular matrix.
-!- DOWAIN: The basic amino-terminal Arg/Pro-rich binds heparin and heparan sulfate. Binds collagens type I and type II through its leucine-rich repeat domain.
-!- SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN (SLRP) FAMILY. CLASS II SUBFAMILY.
                                                                                                                                                                                                                                                                                                  and may function as a J. SUBCELLULAR LOCATION: Secreted; extracellular matrix.

TISSUE SPECIFICITY: Connective tissue.

DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin heparan sulfate. Binds collagens type I and type II through leucine-rich repeat domain (By similarity).

SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SLRP) FAMILY. CLASS II SUBFAMILY.
SIMILARITY: Contains 12 leucine-rich (LRR) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        c. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).
FUNCTION: May anchor basement membranes to the underlying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       connective tissue (By similarity)

C. --- CATALYTIC ACTIVITY: ATP + L-cysteine + tRNA(Cys) = AMP +
C.-- SIMILAR IOCATION: Cytoplasmic.
C. --- SIMILARITY: Belongs to Class-I aminoacyl-tRNA synthetase family.
C. Strong, to methionyl-tRNA synthetase.

Widely expressed in the presumptive mesencephalon and rhombomerse 1-4 until the 2-3-somite stage, with expression persisting in ngn1-positive clusters. First detected in the olfactory placodes at the 5-somite stage. In the spinal cord, detected in ngn1-positive clusters of primary neuroblasts during the early somite stages. Expression decreases in the spinal cord from the 30-somite stage but persists in the olfactory bulb and regions of the rhombencephalon and brain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "The Bacillus subtilis spoVD gene encodes a mother-cell-specific penicillin-binding protein required for spore morphogenesis.";
J. Mol. Biol. 235:209-220(1994).

i. Mol. Biol. 235:209-220(1994).

i. FUNCTION: PENICILLIN-BINDING PROTEINS (PBPS) FUNCTION IN THE LATE STEPS OF MUREIN BIOSYNTHESIS. PBP-2B IS REQUIRED FOR VEGETATIVE CELL DIVISION AND SPORULATION SEPTATION. BETALACTAMASE INACTIVATE THE PBPS BY ACYLATING AN ESSENTIAL SERINE RESIDUE IN THE ACTIVE SITE OF THESE PROTEINS, THEREBY INTERRUPTING NORMAL CELL WALL SYNTHESIS.

i. SUBCELLULAR LOCATION: Type II membrane protein.
i. DEVELOPMENTAL STAGE: SYNTHESIZED THROUGHOUT VEGETATIVE GROWTH.
SYNTHESIS IS ENHANCED DURING STAGE II OF SPORULATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted

It is possible that it carries out the mismatch recognition step. This protein has a weak ATPase activity (By similarity).
-!- SIMILARITY: BELONGS TO THE DNA MISMATCH REPAIR MUTS FAMILY.

IsoId=O95180-2; Sequence=VSP 000949;
IsoId=O95180-2; Sequence=VSP 000949;
Isoform 2 seems to be testis-specific.
IDOMAIN: EACH OF THE FOUR INTERNAL REPEATS CONTAINS FIVE
HYDROPHOBIC TRANSMEMBRANE SEGMENTS (S1, S2, S3, S5, S6) AND ONE
POSITIVELY CHARGED TRANSMEMBRANE SEGMENT (S4). S4 SEGMENTS
PROBABLY REPRESENT THE VOLTAGE-SENSOR AND ARE CHARACTERIZED BY A
SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION.
IN TRESPONSE TO RAISING OF INTRACELLULAR CALCIUM, THE T-TYPE
CHANNELS ARE ACTIVATED BY CAM-KINASE II.
IS SIMILARITY: BELONGS TO THE CALCIUM CHANNEL ALPHA-1 SUBUNITS
PAMILY.
CAUTION: AT-AC pre mRNA splicing gives rise to the isoform 1 shown
in this entry. The additional 20 amino acids found in the Ref. 4
and Ref. 6 sequences are due to a misunderstanding of the real type
of splicing mechanism involved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     + +

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BELONG TO THE "LOW-VOLTAGE ACTIVATED (LVA)" GROUP AND ARE STRONGLY BLOCKED BY NICKEL AND MIBERRADIL. A PARTICULARITY OF THIS TYPE OF CHANNELS IS AN OPENING AT QUITE NEGATIVE POTENTIALS, AND A VOLTAGE-DEPENDENT INACTIVATION. T-TYPE CHANNELS SERVE PACEMAKING FUNCTIONS IN BOTH CENTRAL NEURONS AND CARDIAC NODAL CELLS AND SUPPORT CALCIUM SIGNALING IN SECRETORY CELLS AND VASCULAR SMOOTH MUSCLE. THEY MAY ALSO BE INVOLVED IN THE MODULATION OF PIRING PATTERNS OF NEURONS WHICH IS IMPORTANT FOR INFORMATION PROCESSING AS WELL AS IN CELL GROWTH PROCESSES.
SUBCELLULAR LOCATION: Integral membrane protein.
